### Time table (morning)

Time	Session	L/P	Description
09.00 - 09.15		L	Overview
09.15 - 10.00	I	L	Introduction to missing data
10.00 - 10.30	I	P	Ad hoc methods + MICE
10.30 - 10.45			PAUSE
10.45 - 11.30	II	L	Multiple imputation
11.30 - 12.00	II	P	Boys data
12.00 - 13.15			PAUSE

Universiteit Utrecht

TNO

SvB

### Why this course?

- Missing data are everywhere
- Ad-hoc fixes often do not work
- Multiple imputation is broadly applicable, yield correct statistical inferences, and there is good software
- Goal of the course: get comfortable with a modern and powerful way of solving missing data problems

Universiteit Utrecht

TNO

SvB

Handling Missing Data in R with MICE

# SESSION I

Universiteit Utrecht

TNO

SvB

Handling Missing Data in R with MICE &gt; I &gt; Problem of missing data

## Causes of missing data

- Respondent skipped the item
- Data transmission/coding error
- Drop out in longitudinal research
- Refusal to cooperate
- Sample from population
- Question not asked, different forms
- Censoring

Universiteit Utrecht

TNO

SvB

Handling Missing Data in R with MICE &gt; I &gt; Ad-hoc methods

## Listwise deletion

- Analyze only the complete records
- Also known as Complete Case Analysis (CCA)
- Advantages
  - Simple (default in most software)
  - Unbiased under MCAR
  - Correct standard errors, significance levels
- Two special properties in regression

Universiteit Utrecht

TNO

SvB

Handling Missing Data in R with MICE &gt; I &gt; Ad-hoc methods

## Mean imputation

- Replace the missing values by the mean of the observed data
- Advantages
  - Simple
  - Unbiased for the mean, under MCAR

Universiteit Utrecht

TNO

SvB

## Why are missing data interesting?

- Obviously the best way to treat missing data is not to have them. (Orchard and Woodbury 1972)
- Sooner or later (usually sooner), anyone who does statistical analysis runs into problems with missing data (Allison, 2002)
- Missing data problems are the heart of statistics

Universiteit Utrecht

TNO

SvB

Handling Missing Data in R with MICE &gt; I &gt; Problem of missing data

## Consequences of missing data

- Less information than planned
- Enough statistical power?
- Different analyses, different  $n$ 's
- Cannot calculate even the mean
- Systematic biases in the analysis
- Appropriate confidence interval,  $P$ -values?

In general, missing data can severely complicate interpretation and analysis.

Universiteit Utrecht

TNO

SvB

Handling Missing Data in R with MICE &gt; I &gt; Ad-hoc methods

## Listwise deletion

- Disadvantages
  - Wasteful
  - Large standard errors
  - Biased under MAR, even for simple statistics like the mean
  - Inconsistencies in reporting

Universiteit Utrecht

TNO

SvB

Handling Missing Data in R with MICE &gt; I &gt; Ad-hoc methods

## Mean imputation

Universiteit Utrecht

TNO

SvB

## Mean imputation

- Disadvantages
  - Disturbs the distribution
  - Underestimates the variance
  - Biases correlations to zero
  - Biased under MAR
- AVOID (unless you know what you are doing)

Universiteit Utrecht

TNO

SvB

## Regression imputation

Universiteit Utrecht

TNO

SvB

## Stochastic regression imputation

- Like regression imputation, but adds appropriate noise to the predictions to reflect uncertainty
- Advantages
  - Preserves the distribution of  $Y_{\text{obs}}$
  - Preserves the correlation between  $Y$  and  $X$  in the imputed data

Universiteit Utrecht

TNO

SvB

## Stochastic regression imputation

- Disadvantages
  - Symmetric and constant error restrictive
  - Single imputation does not take uncertainty imputed data into account, and incorrectly treats them as real
  - Not so simple anymore

Universiteit Utrecht

TNO

SvB

## Regression imputation

- Also known as *prediction*
- Fit model for  $Y_{\text{obs}}$  under listwise deletion
- Predict  $Y_{\text{mis}}$  for records with missing  $Y$ 's
- Replace missing values by prediction
- Advantages
  - Unbiased estimates of regression coefficients (under MAR)
  - Good approximation to the (unknown) true data if explained variance is high
- Prediction is the favorite among non-statisticians

Universiteit Utrecht

TNO

SvB

## Regression imputation

- Disadvantages
  - Artificially increases correlations
  - Systematically underestimates the variance
  - Too optimistic  $P$ -values and too short confidence intervals
- AVOID. Harmful to statistical inference.

Universiteit Utrecht

TNO

SvB

## Stochastic regression imputation

Universiteit Utrecht

TNO

SvB

## Single imputation methods, wrapup

- Underestimate uncertainty caused by the missing data
- Unbiased only under restrictive assumptions

Universiteit Utrecht

TNO

SvB

## Alternatives

- Maximum Likelihood, Direct Likelihood
  - Weighting
  - Multiple Imputation
- 
- Little, R.J.A. Rubin D.B. (2002) Statistical Analysis with Missing Data. Second Edition. John Wiley Sons, New York.

Universiteit Utrecht

TNO

SvB

Handling Missing Data in R with MICE &gt; II &gt; What is multiple imputation

## Rising popularity of multiple imputation

Universiteit Utrecht

TNO

SvB

Handling Missing Data in R with MICE &gt; II &gt; What is multiple imputation

## Steps in mice

Universiteit Utrecht

TNO

SvB

Handling Missing Data in R with MICE &gt; II &gt; Goal

## Goal of multiple imputation

Estimate  $Q$  by  $\hat{Q}$  or  $\bar{Q}$  accompanied by a valid estimate of its uncertainty.

What is the difference between  $\hat{Q}$  or  $\bar{Q}$ ?

- $\hat{Q}$  and  $\bar{Q}$  both estimate  $Q$
- $\hat{Q}$  accounts for the sampling uncertainty
- $\bar{Q}$  accounts for the sampling *and* missing data uncertainty

Universiteit Utrecht

TNO

SvB

## SESSION II

Universiteit Utrecht

TNO

SvB

Handling Missing Data in R with MICE &gt; II &gt; What is multiple imputation

## Main steps used in multiple imputation

Incomplete data   Imputed data   Analysis results   Pooled results

Universiteit Utrecht

TNO

SvB

Handling Missing Data in R with MICE &gt; II &gt; Goal

## Estimand

$Q$  is a quantity of scientific interest in the population.

$Q$  can be a vector of population means, population regression weights, population variances, and so on.

$Q$  may not depend on the particular sample, thus  $Q$  cannot be a standard error, sample mean,  $p$ -value, and so on.

Universiteit Utrecht

TNO

SvB

Handling Missing Data in R with MICE &gt; II &gt; Multiple imputation theory

## Pooled estimate $\bar{Q}$

$\hat{Q}_\ell$  is the estimate of the  $\ell$ -th repeated imputation

$\hat{Q}_\ell$  contains  $k$  parameters and is represented as a  $k \times 1$  column vector

The pooled estimate  $\bar{Q}$  is simply the average

$$\bar{Q} = \frac{1}{m} \sum_{\ell=1}^m \hat{Q}_\ell \quad (1)$$

Universiteit Utrecht

TNO

SvB

## Within-imputation variance

Average of the complete-data variances as

$$\bar{U} = \frac{1}{m} \sum_{\ell=1}^m \bar{U}_{\ell}, \quad (2)$$

where  $\bar{U}_{\ell}$  is the variance-covariance matrix of  $\hat{Q}_{\ell}$  obtained for the  $\ell$ -th imputation

$\bar{U}_{\ell}$  is the variance of the estimate, *not* the variance in the data

The within-imputation variance is large if the sample is small

Universiteit Utrecht

TNO

SvB

## Total variance

The total variance is *not* simply  $T = \bar{U} + B$

The correct formula is

$$\begin{aligned} T &= \bar{U} + B + B/m \\ &= \bar{U} + \left(1 + \frac{1}{m}\right) B \end{aligned} \quad (4)$$

for the total variance of  $\bar{Q}$ , and hence of  $(Q - \bar{Q})$  if  $\bar{Q}$  is unbiased  
The term  $B/m$  is the simulation error

Universiteit Utrecht

TNO

SvB

## Variance ratio's (1)

Proportion of the variation attributable to the missing data

$$\lambda = \frac{B + B/m}{T}, \quad (5)$$

Relative increase in variance due to nonresponse

$$r = \frac{B + B/m}{\bar{U}} \quad (6)$$

These are related by  $r = \lambda/(1 - \lambda)$ .

Universiteit Utrecht

TNO

SvB

Statistical inference for  $\bar{Q}$  (1)

The  $100(1 - \alpha)\%$  confidence interval of a  $\bar{Q}$  is calculated as

$$\bar{Q} \pm t_{(\nu, 1-\alpha/2)} \sqrt{\bar{T}}, \quad (9)$$

where  $t_{(\nu, 1-\alpha/2)}$  is the quantile corresponding to probability  $1 - \alpha/2$  of  $t_{\nu}$ .

For example, use  $t(10, 0.975) = 2.23$  for the 95% confidence interval for  $\nu = 10$ .

Universiteit Utrecht

TNO

SvB

## Between-imputation variance

Variance between the  $m$  complete-data estimates is given by

$$B = \frac{1}{m-1} \sum_{\ell=1}^m (\hat{Q}_{\ell} - \bar{Q})(\hat{Q}_{\ell} - \bar{Q})', \quad (3)$$

where  $\bar{Q}$  is the pooled estimate (c.f. equation 1)

The between-imputation variance is large there many missing data

Universiteit Utrecht

TNO

SvB

## Three sources of variation

In summary, the total variance  $T$  stems from three sources:

- $\bar{U}$ , the variance caused by the fact that we are taking a sample rather than the entire population. This is the conventional statistical measure of variability;
- $B$ , the extra variance caused by the fact that there are missing values in the sample;
- $B/m$ , the extra simulation variance caused by the fact that  $\bar{Q}$  itself is based on finite  $m$ .

Universiteit Utrecht

TNO

SvB

## Variance ratio's (2)

Fraction of information about  $Q$  missing due to nonresponse

$$\gamma = \frac{r + 2/(\nu + 3)}{1 + r} \quad (7)$$

This measure needs an estimate of the degrees of freedom  $\nu$ .

Relation between  $\gamma$  and  $\lambda$

$$\gamma = \frac{\nu + 1}{\nu + 3} \lambda + \frac{2}{\nu + 3}. \quad (8)$$

The literature often confuses  $\gamma$  and  $\lambda$ .

Universiteit Utrecht

TNO

SvB

Statistical inference for  $\bar{Q}$  (2)

Suppose we test the null hypothesis  $Q = Q_0$  for some specified value  $Q_0$ . We can find the  $p$ -value of the test as the probability

$$P_s = \Pr \left[ F_{1, \nu} > \frac{(Q_0 - \bar{Q})^2}{\bar{T}} \right] \quad (10)$$

where  $F_{1, \nu}$  is an  $F$  distribution with 1 and  $\nu$  degrees of freedom.

Universiteit Utrecht

TNO

SvB

## Degrees of freedom (1)

With missing data,  $n$  is effectively lower. Thus, the degrees of freedom in statistical tests need to be adjusted.

The 'old' formula assumes  $n = \infty$ :

$$\begin{aligned}\nu_{\text{old}} &= (m-1) \left(1 + \frac{1}{r^2}\right) \\ &= \frac{m-1}{\lambda^2}\end{aligned}\quad (11)$$

Universiteit Utrecht

TNO

SvB

How large should  $m$  be?

Classic advice:  $m = 3, 5, 10$ . More recently: set  $m$  higher: 20–100. Some advice

- 1 Use  $m = 5$  or  $m = 10$  if the fraction of missing information is low,  $\gamma < 0.2$ .
- 2 Develop your model with  $m = 5$ . Do final run with  $m$  equal to percentage of incomplete cases.
- 3 Repeat the analysis with  $m = 5$  with different seeds. If there are large differences for some parameters, this means that the data contain little information about them.

Universiteit Utrecht

TNO

SvB

## Relation between temperature and gas consumption

Universiteit Utrecht

TNO

SvB

## Degrees of freedom (2)

The new formula is

$$\nu = \frac{\nu_{\text{old}} \nu_{\text{obs}}}{\nu_{\text{old}} + \nu_{\text{obs}}}. \quad (12)$$

where the estimated observed-data degrees of freedom that accounts for the missing information is

$$\nu_{\text{obs}} = \frac{\nu_{\text{com}} + 1}{\nu_{\text{com}} + 3} \nu_{\text{com}} (1 - \lambda). \quad (13)$$

with  $\nu_{\text{com}} = n - k$ .

sample	Simple random sample	any

Universiteit Utrecht

TNO

SvB

## Problems in multivariate imputation

- Predictors themselves can be incomplete
- Mixed measurement levels
- Order of imputation can be meaningful
- Too many predictor variables
- Relations could be nonlinear
- Higher order interactions
- Impossible combinations

Universiteit Utrecht

TNO

SvB

## Three general strategies

- Monotone data imputation
- Joint modeling
- Fully conditional specification (FCS)

Universiteit Utrecht

TNO

SvB

## Imputation of monotone pattern

Universiteit Utrecht

TNO

SvB

## Imputation of monotone pattern

Universiteit Utrecht

TNO

SvB

## Imputation of monotone pattern

Universiteit Utrecht

TNO

SvB

## Joint Modeling (JM)

- Specify joint model  $P(Y, X, R)$
- Derive  $P(Y_{\text{mis}} | Y_{\text{obs}}, X, R)$
- Use MCMC techniques to draw imputations  $\dot{Y}_{\text{mis}}$

Universiteit Utrecht

TNO

SvB

## Joint modeling: Software

R/S Plus	norm, cat, mix, pan, Amelia
SAS	proc MI, proc MIANALYZE
STATA	MI command
Stand-alone	Amelia, solas, norm, pan

Universiteit Utrecht

TNO

SvB

## Joint Modeling: Pro's

- Yield correct statistical inference under the assumed JM
- Efficient parametrization (if the model fits)
- Known theoretical properties
- Works very well for parameters close to the center
- Many applications

Universiteit Utrecht

TNO

SvB

## Joint Modeling: Con's

- Lack of flexibility
- May lead to large models
- Can assume more than the complete data problem
- Can impute impossible data

Universiteit Utrecht

TNO

SvB

## Fully Conditional Specification (FCS)

- Specify  $P(Y_{\text{mis}} | Y_{\text{obs}}, X, R)$
- Use MCMC techniques to draw imputations  $\dot{Y}_{\text{mis}}$

Universiteit Utrecht

TNO

SvB

## Multivariate Imputation by Chained Equations (MICE)

- MICE algorithm
- Specify imputation model for each incomplete column
- Fill in starting imputations
- And iterate
- Model: Fully Conditional Specification (FCS)

Universiteit Utrecht

TNO

SvB

## Fully Conditional Specification: Con's

- Theoretical properties only known in special cases
- Cannot use computational shortcuts, like sweep-operator
- Joint distribution may not exist (incompatibility)

Universiteit Utrecht

TNO

SvB

## Fully Conditional Specification (FCS): Software

R	mice, transcan, mi, VIM, baboon
SPSS V17	procedure multiple imputation
SAS	IVEware, SAS 9.3
STATA	ice command, multiple imputation command
Stand-alone	Solas, Mplus

Universiteit Utrecht

TNO

SvB

## Non-convergence

Universiteit Utrecht

TNO

SvB

## SESSION IV

Universiteit Utrecht

TNO

SvB

## Fully Conditional Specification: Pro's

- Easy and flexible
- Imputes close to the data, prevents impossible data
- Subset selection of predictors
- Modular, can preserve valuable work
- Works well, both in simulations and practice

Universiteit Utrecht

TNO

SvB

## How many iterations?

- Quick convergence
- 5–10 iterations is adequate for most problems
- More iterations if  $\lambda$  is high
- inspect the generated imputations
- Monitor convergence to detect anomalies

Universiteit Utrecht

TNO

SvB

## Convergence

Universiteit Utrecht

TNO

SvB

## Imputation model choices

- MAR or MNAR
- Form of the imputation model
- Which predictors
- Derived variables
- What is  $m$ ?
- Order of imputation
- Diagnostics, convergence

Universiteit Utrecht

TNO

SvB

## Which predictors?

- Include all variables that appear in the complete-data model
- In addition, include the variables that are related to the nonresponse
- In addition, include variables that explain a considerable amount of variance
- Remove from the variables selected in steps 2 and 3 those variables that have too many missing values within the subgroup of incomplete cases.

Function `quickpred()` and `flux()`

Universiteit Utrecht

TNO

SvB

## Derived variables

- ratio of two variables
- sum score
- index variable
- quadratic relations
- interaction term
- conditional imputation
- compositions

Universiteit Utrecht

TNO

SvB

## How to impute a ratio?

weight/height ratio: `whr=wgt/hgt` kg/m.

Easy if only one of `wgt` or `hgt` or `whr` is missing

Methods

- POST: Impute `wgt` and `hgt`, and calculate `whr` after imputation
- JAV: Impute `whr` as 'just another variable'
- PASSIVE1: Impute `wgt` and `hgt`, and calculate `whr` during imputation
- PASSIVE2: As PASSIVE1 with adapted predictor matrix

Universiteit Utrecht

TNO

SvB

## Method POST

```
> imp1 <- mice(boys)
> long <- complete(imp1, "long", inc = TRUE)
> long$whr <- with(long, wgt/(hgt/100))
> imp2 <- long2mids(long)
```

Universiteit Utrecht

TNO

SvB

## Method JAV: Just another variable

```
> boys$whr <- boys$wgt/(boys$hgt/100)
> imp.jav <- mice(boys, m = 1, seed = 32093, maxit = 10)
```

Universiteit Utrecht

TNO

SvB

## Method JAV

Universiteit Utrecht

TNO

SvB

## Method PASSIVE

```
> meth["whr"] <- "~I(wgt/(hgt/100))"
```

Universiteit Utrecht

TNO

SvB

## Method PASSIVE, predictor matrix

```
      age hgt wgt bmi hc gen phb tv reg whr
age    0  0  0  0  0  0  0  0  0  0
hgt    1  0  1  0  1  1  1  1  1  0
wgt    1  1  0  0  1  1  1  1  1  0
bmi    1  1  1  0  1  1  1  1  1  0

whr	1	1	1	1	1	1	1	1	1	0

Universiteit Utrecht

TNO

SvB

## Method PASSIVE2

Universiteit Utrecht

TNO

SvB

## Derived variables: summary

- Derived variables pose special challenges
- Plausible values respect data dependencies
- If you can, create derived variables after imputation
- If you cannot, use passive imputation
- Break up direct feedback loops using the predictor matrix

Universiteit Utrecht

TNO

SvB

## Standard diagnostic plots in mice

Since mice 2.5, plots for imputed data:

- one-dimensional scatter: stripplot
- box-and-whisker plot: bwplot
- densities: densityplot
- scattergram: xyplot

Universiteit Utrecht

TNO

SvB

## Stripplot

```
> library(mice)
> imp <- mice(nhanes, seed = 29981)
> stripplot(imp, pch = c(1, 19))
```

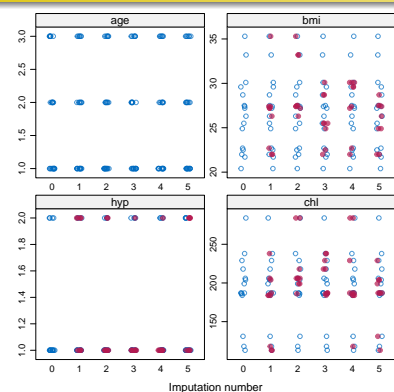

Universiteit Utrecht

TNO

SvB

## stripplot(imp, pch=c(1,19))

Universiteit Utrecht

TNO

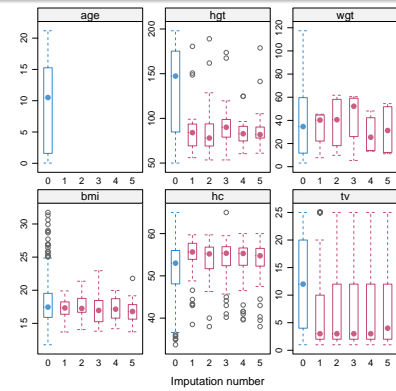

SvB

## A larger data set

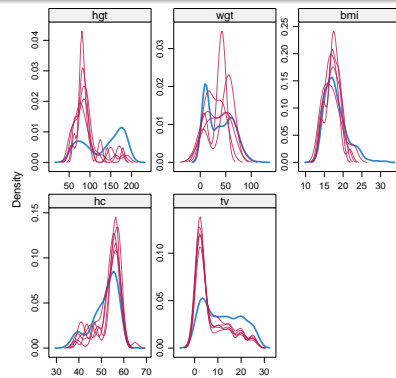

```
> imp <- mice(boys, seed = 24331, maxit = 1)
> bwplot(imp)
```

## bwplot(imp)

## densityplot(imp)

## SESSION V

## Reporting guidelines

- ① Amount of missing data
